Case 2 000000

# The Kazdan Warner problem

A old problem in geometric analysis consists in prescribing the curvature of a surface. In other words, given  $\Sigma$  a compact surface and  $\tilde{K}: \Sigma \to \mathbb{R}$ , does there exist  $\tilde{g}$  so that  $\tilde{K}(x)$  is the curvature of  $(\Sigma, \tilde{g})$ ?

If we fix a metric g, we can look for the new metric  $\tilde{g}$  as a conformal deformation of g, that is,  $\tilde{g} = e^{2u}g$ . In such case, we get:

$$-\Delta_g u + K(x) = \tilde{K}(x)e^{2u}.$$
 (1)

Case 2 000000

# The Kazdan Warner problem

A old problem in geometric analysis consists in prescribing the curvature of a surface. In other words, given  $\Sigma$  a compact surface and  $\tilde{K}: \Sigma \to \mathbb{R}$ , does there exist  $\tilde{g}$  so that  $\tilde{K}(x)$  is the curvature of  $(\Sigma, \tilde{g})$ ?

If we fix a metric g, we can look for the new metric  $\tilde{g}$  as a conformal deformation of g, that is,  $\tilde{g} = e^{2u}g$ . In such case, we get:

$$-\Delta_g u + K(x) = \tilde{K}(x)e^{2u}.$$
 (1)

By integrating, we obtain:

$$\int_{\Sigma} K(x) \, dV_g = \int_{\Sigma} \tilde{K}(x) e^{2u} \, dV_g = \rho$$

Case 1

(日) (日) (日) (日) (日) (日) (日)

Case 2 000000

# The Kazdan Warner problem

A old problem in geometric analysis consists in prescribing the curvature of a surface. In other words, given  $\Sigma$  a compact surface and  $\tilde{K}: \Sigma \to \mathbb{R}$ , does there exist  $\tilde{g}$  so that  $\tilde{K}(x)$  is the curvature of  $(\Sigma, \tilde{g})$ ?

If we fix a metric g, we can look for the new metric  $\tilde{g}$  as a conformal deformation of g, that is,  $\tilde{g} = e^{2u}g$ . In such case, we get:

$$-\Delta_g u + K(x) = \tilde{K}(x)e^{2u}.$$
 (1)

By integrating, we obtain:

$$\int_{\Sigma} K(x) \, dV_g = \int_{\Sigma} \tilde{K}(x) e^{2u} \, dV_g = \rho = 2\pi \chi(\Sigma).$$

Here we restrict ourselves to the positive case,  $\rho > 0$ . Hence, a necessary condition is that  $\tilde{K}$  is positive elsewhere.

The case  $\rho \leq 0$  has been completely described:

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1	Case 2
0000	000000	0000	000000

We can rewrite the equation:

$$-\Delta_g u + \mathcal{K}(x) = \rho \frac{\tilde{\mathcal{K}}(x) e^{2u}}{\int_{\Sigma} \tilde{\mathcal{K}}(x) e^{2u} \, dV_g}.$$

This is the Euler-Lagrange equation of the energy functional  $I_{\rho}: H^1(\Sigma) \to \mathbb{R}$ ,

$$I_{\rho}(u) = \int \left( |\nabla u|^2 + 2K(x)u 
ight) dV_g - 
ho \log \left( \int_{\Sigma} \tilde{K}(x)e^{2u} dV_g 
ight).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1	Case 2
0000	000000	0000	000000

We can rewrite the equation:

$$-\Delta_g u + \mathcal{K}(x) = 
ho rac{ ilde{\mathcal{K}}(x) e^{2u}}{\int_{\Sigma} ilde{\mathcal{K}}(x) e^{2u} \, dV_g}.$$

This is the Euler-Lagrange equation of the energy functional  $I_{\rho}: H^1(\Sigma) \to \mathbb{R}$ ,

$$I_{\rho}(u) = \int \left( |\nabla u|^2 + 2K(x)u 
ight) dV_g - 
ho \log \left( \int_{\Sigma} \tilde{K}(x)e^{2u} dV_g 
ight).$$

The Moser-Trudinger inequality implies that  $I_{\rho}$  is bounded from below for  $\rho \in (0, 4\pi]$ . Moreover,  $I_{\rho}$  is coercive for  $\rho \in (0, 4\pi)$ , and then a solution can be found as a minimizer. For instance, that solves the problem for  $\Sigma = \mathbb{RP}^2$ , since  $\chi(\mathbb{RP}^2) = 1$ .

J. Moser, Dynamical Systems (M. Peixoto ed.), Academic Press, New York, 1973.

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1 0000	Case 2 000000

The case of the sphere is intrinsically more complicated, and there are counterexamples, already found by Kazdan and Warner. Here,  $\rho = 4\pi$ , which is critical for the Moser-Trudinger inequality.

- S.Y.A. Chang and P. C. Yang, Acta Math. 1987.
- C. C. Chen and C. S. Lin, CPAM 2003.

Moreover, if  $\rho > 4\pi$ ,  $I_{\rho}(\varphi_{\lambda}) \rightarrow -\infty$  as  $\lambda \rightarrow +\infty$ , where:

$$arphi_{\lambda}(x) = \log\left(rac{\lambda}{1+\lambda^2 \textit{dist}(x,x_0)^2}
ight), \quad x_0 \in \Sigma, \ ilde{\mathcal{K}}(x_0) > 0.$$

(日) (日) (日) (日) (日) (日) (日)

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1 0000	Case 2 000000

The previous choice is not casual: indeed, the functions defined in  $\mathbb{R}^2$ :

$$U(x) = \log\left(rac{\lambda}{1+\lambda^2|x-x_0|^2}
ight), \quad \lambda > 0, \; x_0 \in \mathbb{R}^2,$$

are the unique entire solutions of the problem:

$$-\Delta U(x) = 4e^{2U(x)}, \quad x \in \mathbb{R}^2$$

with  $e^{2u} \in L^1(\mathbb{R}^2)$ .

W. Chen and C. Li, Duke Math. J. 1991.

We say that p is a conical point of  $(\Sigma, g)$  of degree  $\alpha > -1$  if in a neighborhood of p,

 $g=h(x)g_0,$ 

where  $g_0$  is a smooth metric on  $\Sigma$ , and  $h(x) \sim |x - p|^{2\alpha}$ .

For instance, the vertex of a cone of total angle  $\theta$  is a conical point of order  $\alpha$ , with  $\theta = 2\pi(1 + \alpha)$ . The case  $\alpha > 0$  gives rise to non-embedded conical points.

Case 2 000000

# Compact surfaces with conical singularities

We say that p is a conical point of  $(\Sigma, g)$  of degree  $\alpha > -1$  if in a neighborhood of p,

 $g=h(x)g_0,$ 

where  $g_0$  is a smooth metric on  $\Sigma$ , and  $h(x) \sim |x - p|^{2\alpha}$ .

For instance, the vertex of a cone of total angle  $\theta$  is a conical point of order  $\alpha$ , with  $\theta = 2\pi(1 + \alpha)$ . The case  $\alpha > 0$  gives rise to non-embedded conical points.

Now we are interested in prescribing both the curvature on  $\Sigma$  and the conical points  $p_i$  (with degree  $\alpha_i$ ). We can build a metric g with those conical points by using partitions of unity. The equation becomes, as previously:

$$-\Delta_g u + K(x) = \tilde{K}(x)e^{2u}.$$

he Kazdan Warner problem	Compact surfaces with conical singularities	Case 1	Case 2
000	00000	0000	000000

As a first difference with respect to the smooth case, the Gauss-Bonnet formula implies now that  $\rho = 2\pi(\chi(\Sigma) + \sum_i \alpha_i)$ .

Recall the expression of  $I_{\rho}$ :

$$I_{\rho}(u) = \int_{\Sigma} \left( |\nabla u|^2 + K(x)u \right) dV_g - \rho \log \left( \int_{\Sigma} \tilde{K}(x) e^{2u} dV_g \right).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

e Kazdan Warner problem	Compact surfaces with conical singularities	Case 1	Case 2
000	00000	0000	000000

As a first difference with respect to the smooth case, the Gauss-Bonnet formula implies now that  $\rho = 2\pi(\chi(\Sigma) + \sum_i \alpha_i)$ .

Recall the expression of  $I_{\rho}$ :

$$I_{\rho}(u) = \int_{\Sigma} \left( |\nabla u|^2 + K(x)u \right) dV_g - \rho \log \left( \int_{\Sigma} \tilde{K}(x) e^{2u} dV_g \right).$$

If we write this expression in terms of  $g_0$ , we obtain:

$$I_{\rho}(u) = \int_{\Sigma} \left( |\nabla u|^2 + K(x)h(x)u \right) dx - \rho \log \Big( \int_{\Sigma} h(x)\tilde{K}(x)e^{2u} dx \Big),$$

where h(x) is positive outside  $p_i$  and  $h(x) \sim |x - p_i|^{2\alpha_i}$ .

A second difference: now  $I_{\rho}$  is bounded from below if  $\rho \leq 4\pi \min\{1, 1 + \alpha_i : i = 1 \dots k\}.$

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1 0000	Case 2 000000

#### Theorem

Assume that  $0 < \rho < 4\pi \min\{1, 1 + \alpha_i : i = 1...k\}$ , and take  $\tilde{K}(x)$  positive elsewhere. Then there exists a minimizer for  $I_{\rho}$ .

## M. Troyanov, TAMS 1991.

There are also some non-existence results. It is known that there does not exist a metric on the sphere with one conical point and constant positive curvature.

Moreover, a metric on the sphere with constant positive curvature and two conical points exists if and only if  $\alpha_1 = \alpha_2$ .

# Motivation from physics

This equation arises also from physical models such as the abelian Chern-Simons-Higgs theory and the Electroweak theory. In this framework, the points  $p_i$  represent vortexes.

## The result

## Theorem

Assume that  $\tilde{K}(x)$  is strictly positive. We rearrange the conical points so that  $0 = \alpha_0 < \alpha_1 \le \alpha_2 \le \ldots \alpha_k \le 1$ . Assume  $\rho \in (4\pi, 8\pi)$ ,  $\rho \ne 4\pi(1 + \alpha_i)$  for any *i*. Assume also that either  $\Sigma$  is not homeomorphic to a sphere or  $\rho \notin (4\pi(1 + \alpha_{k-1}), 4\pi(1 + \alpha_k))$ . Then problem (1) has a solution.

#### A. Malchiodi and D. Ruiz, Geom. and Funct. Anal. 2011.

The second condition may look technical. However, there holds:

#### Theorem

Assume that k = 1,  $\Sigma = S^2$ . If  $\tilde{K}(x) = \tilde{K} > 0$ , then (1) does not admit any solution for any  $\rho \in (4\pi, 4\pi(1 + \alpha))$ .

D. Bartolucci, C.S. Lin and G. Tarantello, DCDS 2010.

Case 1

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Case 2

## The variational argument

The argument of the proof is reminiscent of Morse theory. For any  $L \in \mathbb{R}$ , we define:

$$I_{\rho}^{L} = \{ u \in H^{1}(\Sigma) : I_{\rho}(u) < L \}.$$

By Morse theory, if  $I_{\rho}^{a}$  is not homotopically equivalent to  $I_{\rho}^{b}$ , then there exists a critical point  $u \in H^{1}(\Sigma)$  with  $I_{\rho}(u) \in [a, b]$ .

Compact surfaces with conical singularities  $\circ \circ \circ \circ \circ \bullet$ 

Case 1

(日) (日) (日) (日) (日) (日) (日)

Case 2 000000

## The variational argument

The argument of the proof is reminiscent of Morse theory. For any  $L \in \mathbb{R}$ , we define:

$$I_{\rho}^{L} = \{ u \in H^{1}(\Sigma) : I_{\rho}(u) < L \}.$$

By Morse theory, if  $I_{\rho}^{a}$  is not homotopically equivalent to  $I_{\rho}^{b}$ , then there exists a critical point  $u \in H^{1}(\Sigma)$  with  $I_{\rho}(u) \in [a, b]$ .

It is easy to show that  $I_{\rho}^{L}$  is contractible for L >> 1. Therefore, we will be done if we prove that low sub-levels of  $I_{\rho}$  are not contractible.

Case 1

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Case 2 000000

# Case 1: $\rho \in (4\pi(1 + \alpha_k), 8\pi)$ .

## Proposition

Assume  $h: \Sigma \to \mathbb{R}$  with  $0 \le h(x) \le C_0$ . Let  $\Omega_1, \Omega_2$  be two subsets of  $\Sigma$  with dist $(\Omega_1, \Omega_2) \ge \delta_0 > 0$ , and fix  $\gamma_0 > 0$ . Then, for any  $\varepsilon > 0$  there exists a constant  $C = C(C_0, \varepsilon, \delta_0, \gamma_0)$  such that

$$\log \int_{\Sigma} h(x) e^{2u} \leq C + rac{1}{8\pi - arepsilon} \int_{\Sigma} |
abla u|^2 + 2 \int_{\Sigma} u.$$

for all functions  $u \in H^1(\Sigma)$  satisfying

$$\frac{\int_{\Omega_j} h(x)e^{2u}}{\int_{\Sigma} h(x)e^{2u}} \ge \gamma_0, \qquad j = 1, 2.$$
(2)

W. Chen and C. Li, J. Geom. Anal. 1991.

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1 ○●○○	Case 2 000000

As a consequence we have that for any  $u_n \in H^1$  such that  $I_{\rho}(u_n) \to -\infty$ ,

$$\frac{he^{u_n}}{\int he^{u_n}} \rightharpoonup \delta_x$$

for some  $x \in \Sigma$ . This provides us with a continuous map:

$$\Psi: I_{\rho}^{-M} \to \Sigma,$$

for *M* large enough.

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1	Case 2
0000	000000	0000	000000

Moreover, for  $\lambda > 0$  large we define  $\Phi_{\lambda} : \Sigma \to I_{\rho}^{-M}$  as:

$$\Phi_{\lambda}[x_0](x) = \log\left[\frac{\lambda}{1+\lambda^2|x-x_0|^{2(1+\alpha_k)}}\right]$$

for x in a neighborhood of  $x_0$ .

Again, those functions correspond to the unique entire solutions of the problem

$$-\Delta u = 4(1+\alpha_k)^2 |x-x_0|^{2\alpha_k} e^{2u}.$$

J. Prajapat and G. Tarantello, PRSE 2001.

In order to compute that indeed  $I_{\rho}(\Phi_{\lambda}[x_0]) < -M$  for any  $x_0 \in \Sigma$  we use strongly that  $\rho > 4\pi(1 + \alpha_k)$ .

(日) (日) (日) (日) (日) (日) (日)

Case 1

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Case 2 000000

## Topological properties of sublevels

We can compute the composition:

$$\Sigma \stackrel{\Phi_{\lambda}}{\longrightarrow} I_{\rho}^{-M} \stackrel{\Psi}{\longrightarrow} \Sigma.$$

It is possible to show that  $\Psi \circ \Phi_{\lambda} \to Id$  as  $\lambda \to +\infty$ . So, the composition is  $\Psi \circ \Phi_{\lambda}$  is homotopycally equivalent to the identity. Since  $\Sigma$  is not contractible, neither is  $I_{\rho}^{-M}$ .

# Case 2: $\rho \in (4\pi(1 + \alpha_i), 4\pi(1 + \alpha_{i+1}))$

In this case it seemed impossible to us to define a map  $\Phi_{\lambda} : \Sigma \to I_{\rho}^{-M}$  as before. The problem appears when defining  $\Phi_{\lambda}[p_j], j > i$ . A result that may explain why is the following:

#### Theorem

Let B be the unit ball of  $\mathbb{R}^2$ . Then, for any  $u \in H^1(B)$  radial, there holds:

$$\log \int_{B} |x|^{2lpha} e^{2u} \leq rac{1}{4(1+lpha)\pi} \int_{B} |
abla u|^2 + 2 \int_{B} u + C.$$

That makes one think that now sublevels will not contain functions concentrated around  $p_j$ , j > i.

he Kazdan Warner problem	Compact surfaces with conical singularities	Case 1	Case 2

#### Theorem

Fix  $\rho \in (4\pi, 8\pi)$ . There exists M > 0 and a map  $\beta : I_{\rho}^{-M} \to \Sigma$  such that for any  $\varepsilon > 0$ 

$$\log \int_{\Sigma} |x-p|^{2\alpha} e^{2u} \leq \frac{1}{4\pi(1+\alpha)-\varepsilon} \int_{\Sigma} |\nabla u|^2 + 2 \int_{\Sigma} u + C_{\varepsilon},$$

for any  $u \in I_{\rho}^{-M}$  with  $\beta(u) = p$ .

Actually the map  $\beta$  applies to  $f = \frac{he^{\mu}}{\int he^{\mu}}$ . Let us define:

$$\mathcal{A} = \{f \in L^1(\Sigma), f(x) > 0 \text{ a.e.}, \int_{\Sigma} f = 1\},$$

$$\sigma: \Sigma \times \mathcal{A} \to (\mathbf{0}, +\infty),$$

where  $\sigma = \sigma(x, f)$  is chosen such that (for some C > 0 large):

$$\int_{B_x(\sigma)} f = \int_{B_x(C\sigma)^c} f.$$

The Kazdan Warner problem

Compact surfaces with conical singularities

ase 1

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Case 2

## A barycenter map

Let us define  $T: \Sigma imes \mathcal{A} o (0, +\infty)$ ,

$$T(x,f)=\int_{B_x(\sigma(x,f))}f.$$

Both  $\sigma$  and T are continuous.

There exists  $\tau = \tau(C) > 0$  such that

$$\max_{x\in\Sigma} T(x,f) > 2\tau \ \forall \ f \in \mathcal{A}.$$

The Kazdan Warner problem

Compact surfaces with conical singularities

ase 1

Case 2

## A barycenter map

Let us define  $T: \Sigma \times \mathcal{A} \to (0, +\infty)$ ,

$$T(x,f)=\int_{B_x(\sigma(x,f))}f.$$

Both  $\sigma$  and T are continuous.

There exists  $\tau = \tau(C) > 0$  such that

$$\max_{x\in\Sigma} T(x,f) > 2\tau \ \forall \ f \in \mathcal{A}.$$

By Nash embedding Theorem, we can assume that  $\Sigma \subset \mathbb{R}^N$  isometrically. Let us define:

$$\eta: I_{\rho}^{-M} \to \mathbb{R}^{N}, \ \eta(u) = \frac{\int_{\Sigma} [T(x, f) - \tau]^{+} x}{\int_{\Sigma} [T(x, f) - \tau]^{+}}$$

Moreover, the integrand is nonzero in a very small region for *M* large. So, we can simply define  $\beta(u)$  as the projection of  $\eta(u)$  onto  $\Sigma$ .

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1	Case 2
0000	000000	0000	000000

That map  $\beta$  defined in that way is somehow a barycenter of *u*. In particular, if  $u \in H^1(B)$  is radial,  $\beta(u) = 0$ .

Now we need to show that if  $\beta(u) = p$ , then

$$\log \int_{\Sigma} |x-p|^{2\alpha} e^{2u} \leq \frac{1}{4\pi(1+\alpha)-\varepsilon} \int_{\Sigma} |\nabla u|^2 + 2 \int_{\Sigma} u + C_{\varepsilon}.$$

The proof of that is quite technical and will be skipped in this talk.

The Kazdan Warner problem	Compact surfaces with conical singularities	Case 1	Case 2
0000	000000	0000	000000

Therefore, we can use the barycenter map:

$$\beta: I_{\rho}^{-M} \to \Sigma \setminus \{p_{i+1}, \dots p_k\}$$

for *M* large enough. By using a deformation retract, we can define:

$$\Psi: I_{\rho}^{-M} \to \Sigma \setminus \left( \cup_{j=i+1}^{k} B_{\rho_{j}}(\delta) \right),$$

for small  $\delta$  fixed. Moreover, we can also define:

$$\Phi_{\lambda}: \Sigma \setminus \left( \cup_{j=i+1}^{k} B_{\rho_{j}}(\delta) \right) \rightarrow I_{\rho}^{-M},$$

$$\Phi_{\lambda}[x_0](x) = \log\left[\frac{\lambda}{1+\lambda^2|x-x_0|^{2(1+\alpha_{i+1})}}\right]$$

So, we conclude again whenever  $\Sigma \setminus \left( \bigcup_{j=i+1}^{k} B_{\rho_j}(\delta) \right)$  is not contractible.
