Introduction

- The vessel structure of the blood circulatory system is one of the most complex structures of the body.
- Recent advances on medical imaging provide high resolution images of the vessel structures, allowgin the generation of accurate patient- specific geometric in-vivo vessel models

Introducion

- We aim towards a Vessel Knowledge Representation (VKR) model,
 - efficient and versatil,
 - may be used for a wide variety of image-based vessel extraction schemes and vessel analysis applications.

Requirements of the VKR

- **Versatility:**
 - Modelling of low level entities compatible with higher level structures
 - Coexisting representations
 - Decoupling algorithms from data structures
- **Efficiency:** low computational time and need of resources

- **Usefulness:** take into account constraints from actual applications
- **Hierarchical:** provide levels of complexity and abstraction
- **Integrability:** embedded into state of the art software developments, (ITK)

Model Description

Supported Operations

- Access Operations: graph traversal
- Edition Operations: change the internal structure and properties of the model.
- Quantification Operations: quantitative measurements over the model.
- Input/Output Operations: used to load and save the model data.
- Data Transformation Operations:
 - generation of the VKR model and
 - transformation into another representation
- Model-specific Operations: internal operations

Conclusions

- The Blood Vessel Analysis needs
 - the composition of procedures,
 - the reuse of software and
 - the comparative analysis
- The Vessel Knowledge Representation (VKR) model that may allow the exchange of data among applications and users.
 - reuse of software pieces,
 - an intermediate representation between image-based extraction schemes and clinical and research applications,
 - to perform quantitative measurements on extracted vessel structures and
 - to provide the necessary vessel representation and handling tools for the target applications.

conclusions

- In this paper we have identified,
 - some key knowledge representation items,
 - the key operations that are the building blocks for nowadays and future vessel analysis processes and applications.
- We are already applying the VKR model in vessel-related applications related to our current research areas.
