DESCRIPTION

The LM135, LM235, LM335 are precision temperature sensors which can be easily calibrated. They operate as a 2-terminal Zener and the breakdown voltage is directly proportional to the absolute temperature at 10mV/^{o}K. The circuit has a dynamic impedance of less than 1Ω and operates within a range of current from 450µA to 5mA without alteration of its characteristics. Calibrated at +25^{o}C, the LM135, LM235, LM335 have a typical error of less than 1^{o}C over a 100^{o}C temperature range. Unlike other sensors, the LM135, LM235, LM335 have a linear output.

ORDER CODES

Part number	Temperature Range	Package	
		Z	D
LM135	–55^{o}C, +150^{o}C	•	•
LM235	–40^{o}C, +125^{o}C	•	•
LM335,A	–40^{o}C, +100^{o}C	•	•

APPLICATION HINTS

There is an easy method of calibrating the device for higher accuracies (see typical applications).

The single point calibration works because the output of the LM135, LM235, LM335 is proportional to the absolute temperature with the extrapolated output of sensor going to 0V at 0^oK (–273.15^oC). Errors in output voltage versus temperature are only slope. Thus a calibration of the slope at one temperature corrects errors at all temperatures.

The output of the circuit (calibrated or not) can be given by the equation : $V_{OT} = VO_{TO} \times \frac{T}{T_o}$

where T is the unknown temperature and T_O is the reference temperature (in ^oK).

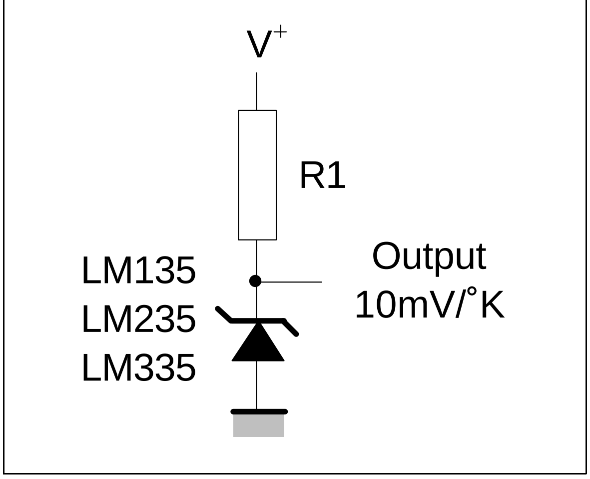
Nominally the output is calibrated at 10mV/^oK.

Precautions should be taken to ensure good sensing accuracy. As in the case of all temperatures sensors, self heating can decrease accuracy. The LM135, LM235, LM335 should operate with a low current, but sufficient to drive the sensor and its calibration circuit to their maximum operating temperature.

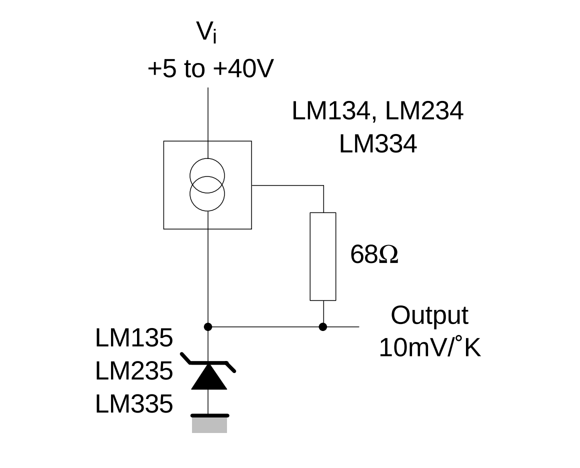
If the sensor is used in surroundings where the thermal resistane is constant, the errors due to self heating can be externally calibrated. This is possible if the circuit is biased with a temperature stable current. Heating will then be proportional to zener voltage and therefore temperature. In this way the error due to self heating is proportional to the absolute temperature as scale factor errors.

TYPICAL APPLICATIONS

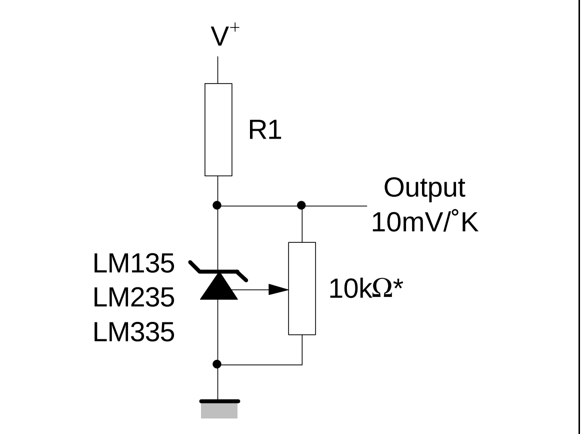
BASIC TEMPERATURE SENSOR



WIDE OPERATING SUPPLY

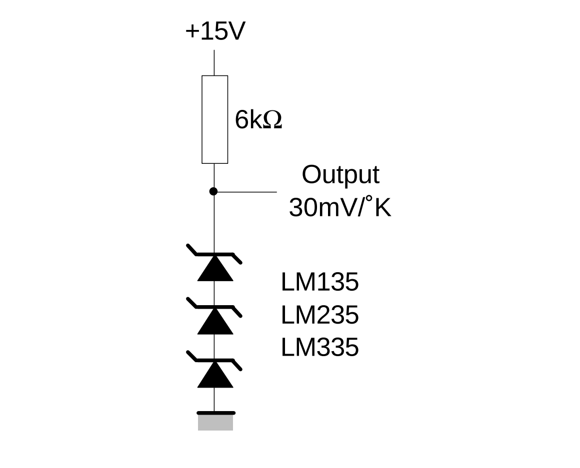


CALIBRATED SENSOR

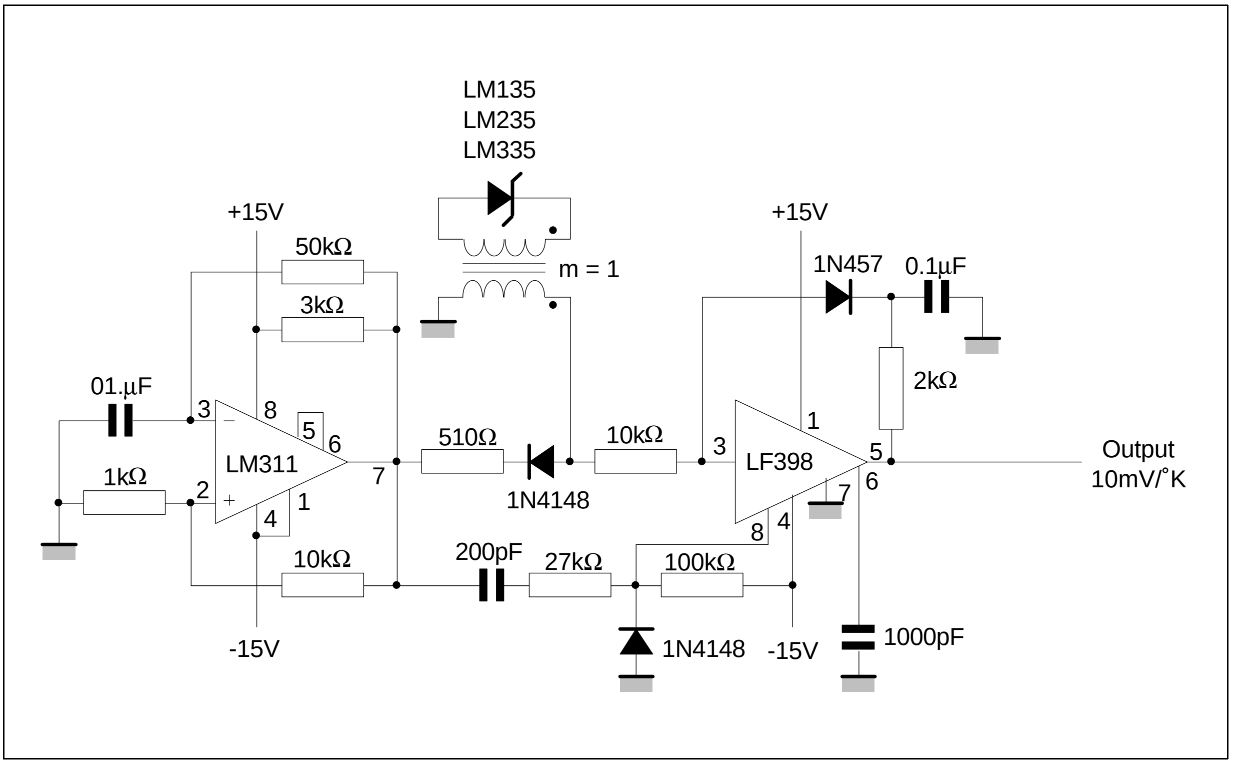


* Calibrate for 2.982V at +25^oC

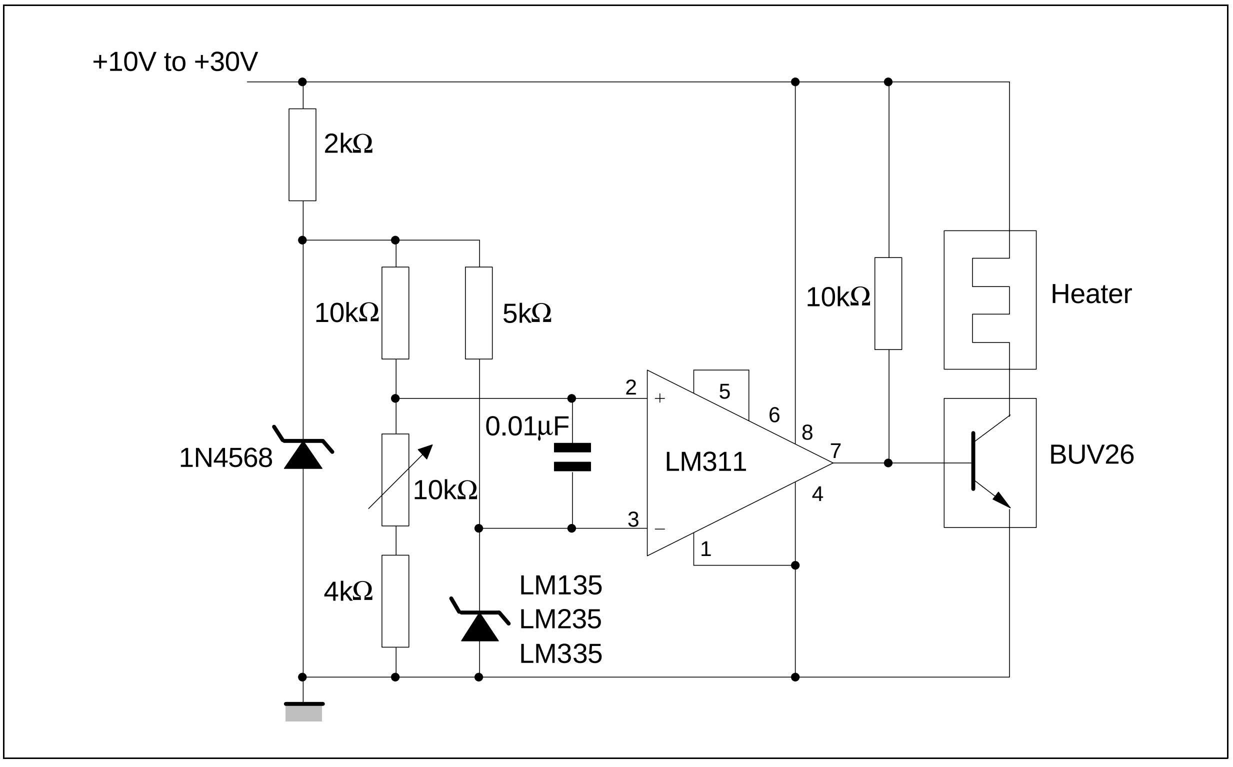
AVERAGE TEMPERATURE SENSING



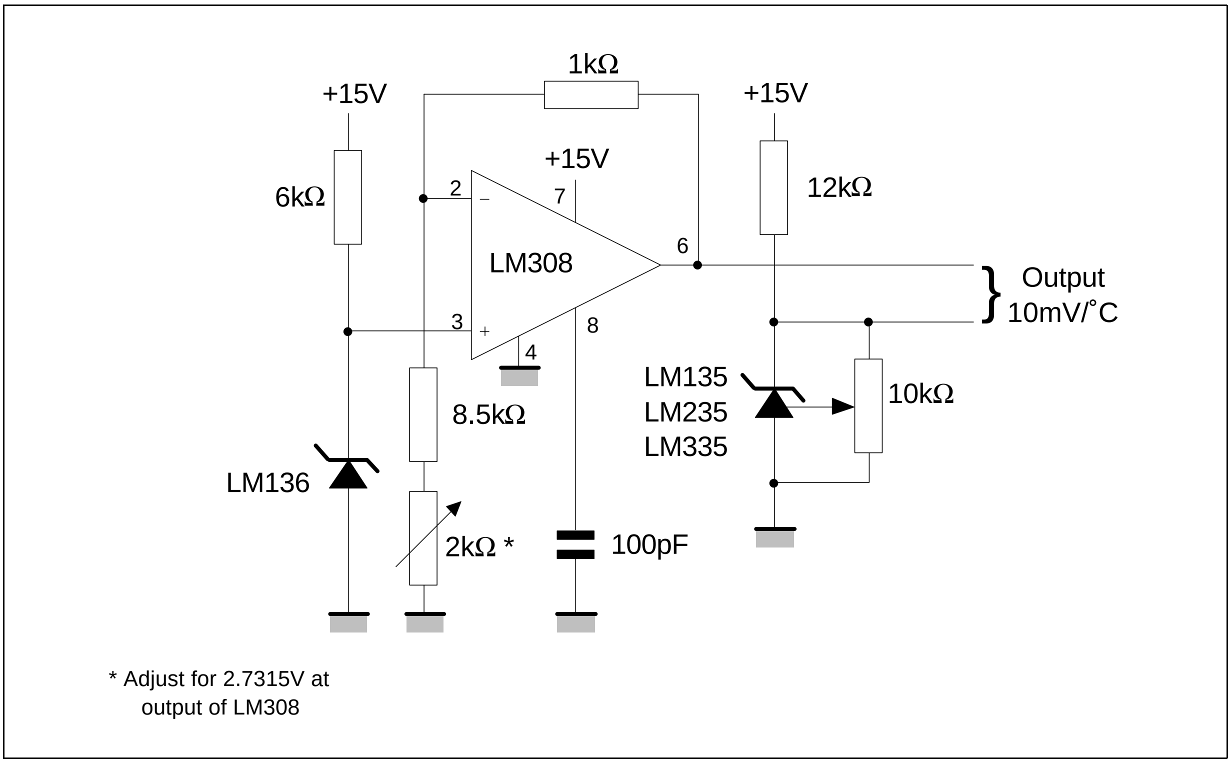
ISOLATED TEMPERATURE SENSOR



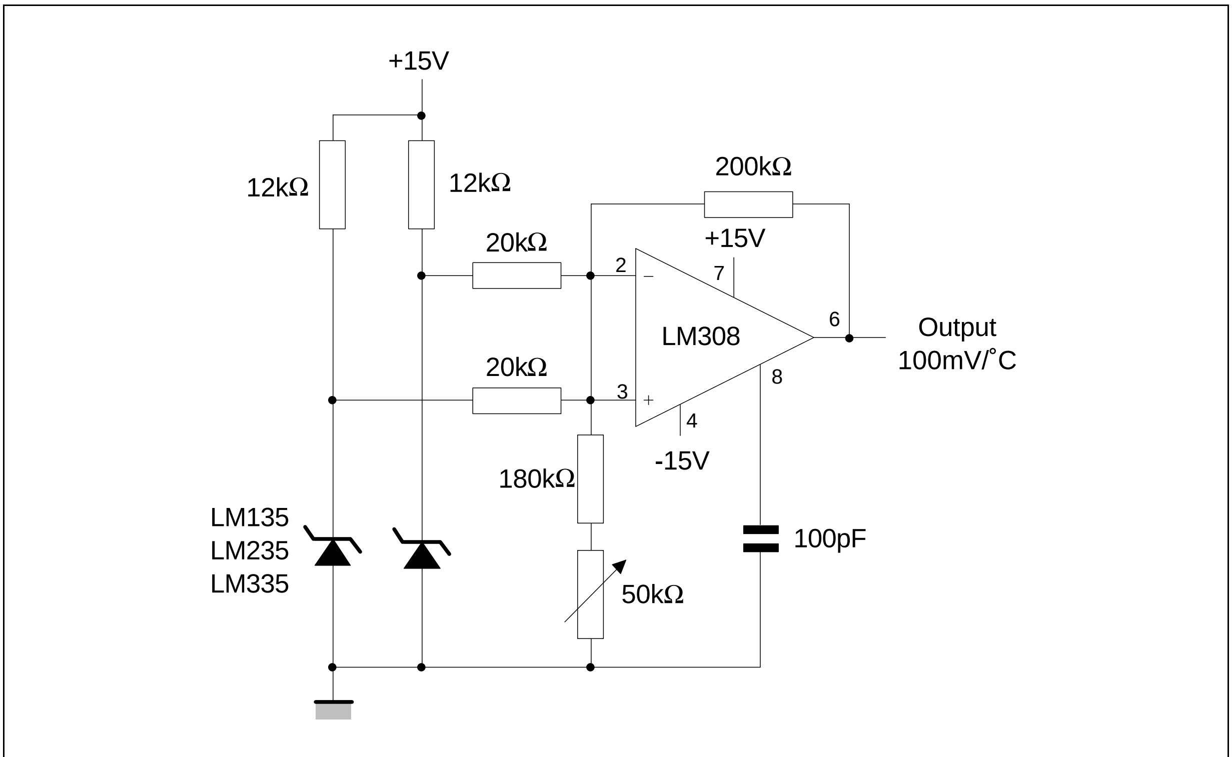
SIMPLE TEMPERATURE CONTROLLER



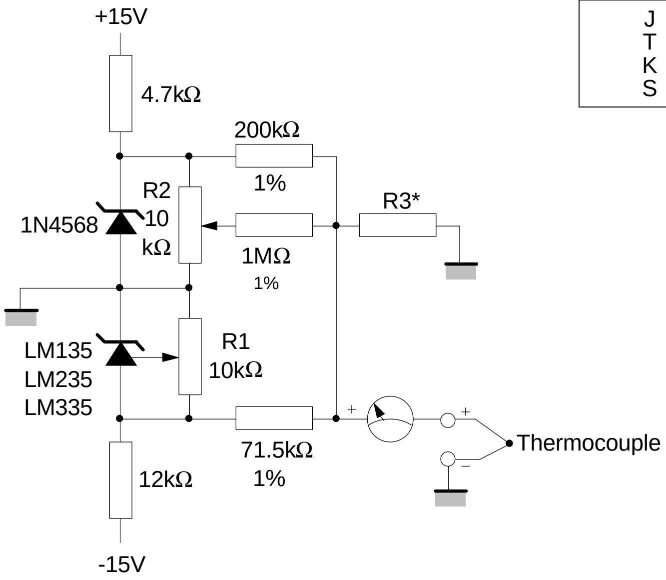
CENTIGRADE THERMOMETER



DIFFERENTIAL TEMPERATURE SENSOR



THERMOCOUPLE COLD JUNCTION COMPENSATION
(compensation for grounded thermocouple)

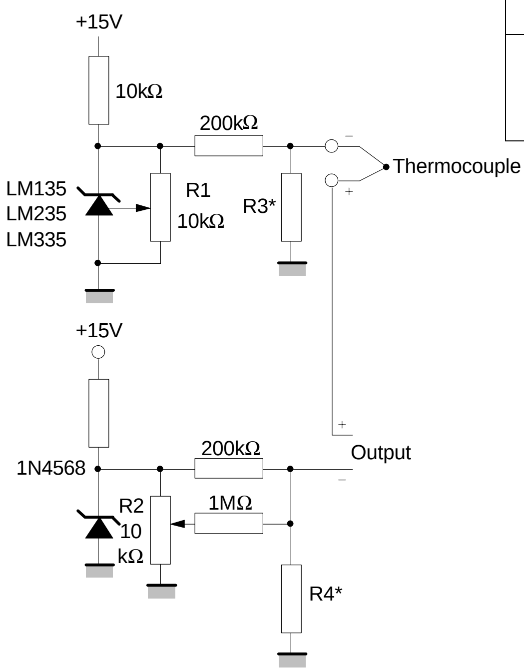


Thermo-couple	R3	Seebeck Coefficient
J	377Ω	52.3µV/°C
T	308Ω	42.8µV/°C
K	293Ω	40.8µV/°C
S	45.8Ω	6.4µV/°C

Adjustments : compensates for both sensor and resistor tolerances.
1. Short 1N4568.
2. Adjust R1 for SEEBECK coefficient times ambient temperature (in degrees K) across R3.
3. Short LM135 and adjust R2 for voltage across R3 corresponding to thermocouple type.
   J 14.32mV K 11.17mV
   T 11.79mV S 1.768mV

* Select R3 for proper thermocouple type

SINGLE POWER SUPPLY COLD JUNCTION COMPENSATION



Thermo-couple	R3	R4	Seebeck Coefficient
J	1.05kΩ	365Ω	52.3µV/°C
T	856Ω	315Ω	42.8µV/°C
K	816Ω	300Ω	40.8µV/°C
S	128Ω	46.3Ω	6.4µV/°C

Adjustments :
1. Adjust R1 for the voltage across R3 equal to the SEEBECK coefficient times ambient temperature in degrees Kelvin.
2. Adjust R2 for voltage across R4 correspon-ding to thermocouple.
   J 14.32mV K 11.17mV
   T 11.79mV S 1.768mV

* Select R3 and R4 for proper thermocouple
