Insertion results

"The set C(X) of all continuous, real-valued functions on a topological space X will be provided with an algebraic structure and an order structure. Since their definitions do not involve continuity, we begin by imposing these structures on the collection \mathbb{R}^X of all functions from X into the set \mathbb{R} of real numbers. [...]

In fact, it is clear that \mathbb{R}^X is a commutative ring with unity element (provided that X is non empty). [...]

Therefore C(X) is a commutative ring, a subring of \mathbb{R}^X ."

L. Gillman and M. Jerison, Rings of Continuous Functions

Let X be a topological space. TFAE:

- (1) X is normal.
- (2) For every disjoint closed sets *F* and *G*, there exists a continuous $h: X \rightarrow [0, 1]$ such that $h(F) = \{0\}$ and $h(G) = \{1\}$.

(3) For every closed set *F* and open set *U* such that *F* ⊆ *U*, there exists a continuous *h* : *X* → ℝ such that χ_F ≤ *h* ≤ χ_U.

Question

Let X be a topological space and let $f, g : X \to \mathbb{R}$ be such that $f \in \text{USC}(X), g \in \text{LSC}(X)$ and $f \leq g$.

Does there exists a continuous $h \in C(X)$ such that $f \le h \le g$

Stone Insertion Theorem.

Let *X* be a topological space and let $f, g : X \to \mathbb{R}$. TFAE:

- (1) X is extremally disconnected (any two disjoint open sets in X have disjoint closures).
- (2) For every $f \in LSC(X)$ and every $g \in USC(X)$ with $f \leq g$, there exists a continuous $h \in C(X)$ such that $f \leq h \leq g$.

M.H. Stone,

Boundedness properties in function-lattices,

Canad. J. Math. 1 (1949) 176-186.

Dowker Insertion Theorem.

Let X be a topological space and let $f, g : X \to \mathbb{R}$. TFAE:

- (1) X is normal and countably paracompact.
- (2) For every $f \in USC(X)$ and every $g \in LSC(X)$ with f < g, there exists a continuous $h \in C(X)$ such that f < h < g.

On countably paracompact spaces, Canad. J. Math. 3 (1951) 219–224.

Michael Insertion Theorem.

Let *X* be a topological space and let $f, g : X \rightarrow \mathbb{R}$. TFAE:

- (1) *X* is perfectly normal (every two disjoint closed sets can be precisely separated by a continuous real valued function).
- (2) For every *f* ∈ USC(*X*) and every *g* ∈ LSC(*X*) with *f* ≤ *g*, there exists a continuous *h* ∈ C(*X*) such that *f* ≤ *h* ≤ *g* and *f*(*x*) < *h*(*x*) < *g*(*x*) whenever *f*(*x*) < *g*(*x*).

Motivation: Kubiak Insertion Theorem

A topological space X is completely normal if for every pair of subsets A and B of X which are separated (i.e. $\overline{A} \cap B = \emptyset = A \cap \overline{B}$) there are disjoint open sets containing A and B respectively.

(A standard exercise is to show that this is equivalent to hereditary normality.)

Kubiak Insertion Theorem.

Let X be a topological space and let $f, g : X \to \mathbb{R}$. TFAE:

(1) X is completely normal.

(2) If $\overline{A} \subseteq B$ and $A \subseteq \overset{\circ}{B}$, then there exists an open set U such that $A \subseteq U \subseteq \overline{U} \subseteq B$.

(3) If f⁻ ≤ g and f ≤ g°, then there exists a lower semicontinuous h : X → R such that f ≤ h ≤ h⁻ ≤ g
(where f⁻ denotes the upper regularization of f and g° denotes the lower regularization of g).

< □ > < □ > < □ > < □ > < □ >

Kubiak Insertion Theorem.

Let X be a topological space and let $f, g : X \to \mathbb{R}$. TFAE:

- (1) X is completely normal.

Pointfree topology

the frame of reals

The fact that Frm is an algebraic category (in particular, one has free frames and quotient frames) permits a procedure familiar from traditional algebra, namely, the definition of a frame by *generators and relations*: take the quotient of the free frame on the given set of generators modulo the congruence generated by the pairs (u, v) for the given relations u = v.

So, in the context of pointfree topology the frame of reals may be introduced independent of any notion of real number:

The *frame of reals* is the frame $\mathfrak{L}(\mathbb{R})$ generated by all ordered pairs (p, q), where $p, q \in \mathbb{Q}$, subject to the following relations:

 $\begin{array}{ll} (\mathsf{R1}) & (p,q) \land (r,s) = (p \lor r,q \land s) \\ (\mathsf{R2}) & p \le r < q \le s \Rightarrow (p,q) \lor (r,s) = (p,s) \\ (\mathsf{R3}) & (p,q) = \bigvee \{ (r,s) \mid p < r < s < q \}. \\ (\mathsf{R4}) & \bigvee \{ (p,q) \mid p,q \in \mathbb{Q} \} = 1. \end{array}$

Semicontinuity

semicontinuous real functions

Let $\mathfrak{L}_{l}(\mathbb{R})$ and $\mathfrak{L}_{u}(\mathbb{R})$ denote the subframes generated by elements:

$$(-,q) := \bigvee_{p \in \mathbb{Q}} (p,q) \text{ and } (p,-) := \bigvee_{q \in \mathbb{Q}} (p,q).$$

One is tempted to follow the lines of the previous definition:

Definition

- (1) An upper semicontinuous real function on *L* is a frame homomorphism $\mathfrak{L}_l(\mathbb{R}) \to L$.
- (2) A lower semicontinuous real function on L is a frame homomorphism L_u(ℝ) → L.

Y.-M. Li and G.-J. Wang,

Localic Katětov-Tong insertion theorem and localic Tietze extension theorem,

Comment. Math. Univ. Carolinae, 38 (1997) 801-814.

- sublocale sets.

We follow the latter approach because, in our opinion, it has revealed to be the more intuitive and the easiest to work with:

A subset $S \subseteq L$ is a *sublocale* of *L* if it satisfies the following: (S1) For every $A \subseteq S$, $\bigwedge A \in S$,

(S2) For every $a \in L$ and $s \in S$, $a \to s \in S$

- as sublocale maps (i.e. onto frame homomorphisms),
- congruences,
- nuclei
- sublocale sets.

We follow the latter approach because, in our opinion, it has revealed to be the more intuitive and the easiest to work with:

A subset $S \subseteq L$ is a *sublocale* of *L* if it satisfies the following: (S1) For every $A \subseteq S$, $\bigwedge A \in S$, (S2) For every $a \in L$ and $s \in S$, $a \to s \in S$.

Since the intersection of sublocales is again a sublocale, the set SL of all sublocales is a complete lattice under inclusion.

For convenience, we shall deal with the opposite order, i.e.:

 $S_1 \leq S_2 \quad \iff \quad S_1 \supseteq S_2.$

 (SL, \leq) is a frame, in which $\{1\}$ is the top and *L* is the bottom.

Further, given $\{S_i \in SL : i \in I\}$, we have

 $\bigvee_{i\in I} S_i = \bigcap_{i\in I} S_i \text{ and } \bigwedge_{i\in I} S_i = \{\bigwedge A : A \subseteq \bigcup_{i\in I} S_i\}.$

J. Gutiérrez García Real valued functions in Pointfree Topology

Since the intersection of sublocales is again a sublocale, the set SL of all sublocales is a complete lattice under inclusion.

For convenience, we shall deal with the opposite order, i.e.:

 $S_1 \leq S_2 \quad \iff \quad S_1 \supseteq S_2.$

 (SL, \leq) is a frame, in which $\{1\}$ is the top and *L* is the bottom.

Further, given $\{S_i \in SL : i \in I\}$, we have

$$\bigvee_{i\in I} S_i = \bigcap_{i\in I} S_i \text{ and } \bigwedge_{i\in I} S_i = \{\bigwedge A : A \subseteq \bigcup_{i\in I} S_i\}.$$

Pointfree topology sublocales (generalized subspaces)

Important examples of sublocales are the *open* and *closed* ones:

 $\mathfrak{o}(a) = \{a \rightarrow b : b \in L\}$ and $\mathfrak{c}(a) = \uparrow a = \{b \in L : a \leq b\}.$

Open and closed sublocales are complemented and

ro(a) = c(a) for each $a \in L$.

Also, for each $a_i, a, b \in L$:

 $\bigvee_{i \in I} \mathfrak{c}(a_i) = \mathfrak{c}(\bigvee_{i \in I} a_i), \qquad \mathfrak{c}(a) \wedge \mathfrak{c}(b) = \mathfrak{c}(a \wedge b)$ $\bigwedge_{i \in I} \mathfrak{o}(a_i) = \mathfrak{o}(\bigvee_{i \in I} a_i) \quad \text{and} \quad \mathfrak{o}(a) \vee \mathfrak{o}(b) = \mathfrak{o}(a \wedge b)$

Thus, $c : L \longrightarrow SL$ is an embedding from *L* into $c(L) = \{c(a) : a \in L\}$ whereas $o : L \longrightarrow SL$ is a dual lattice embedding taking finite meets to joins and arbitrary joins to meets.

Important examples of sublocales are the *open* and *closed* ones:

 $\mathfrak{o}(a) = \{a \rightarrow b : b \in L\}$ and $\mathfrak{c}(a) = \uparrow a = \{b \in L : a \leq b\}.$

Open and closed sublocales are complemented and

 $\neg \mathfrak{o}(a) = \mathfrak{c}(a)$ for each $a \in L$.

Also, for each $a_i, a, b \in L$:

 $\bigvee_{i \in I} \mathfrak{c}(a_i) = \mathfrak{c}(\bigvee_{i \in I} a_i), \qquad \mathfrak{c}(a) \wedge \mathfrak{c}(b) = \mathfrak{c}(a \wedge b)$ $\bigwedge_{i \in I} \mathfrak{o}(a_i) = \mathfrak{o}(\bigvee_{i \in I} a_i) \quad \text{and} \quad \mathfrak{o}(a) \vee \mathfrak{o}(b) = \mathfrak{o}(a \wedge b)$

Thus, $c : L \longrightarrow SL$ is an embedding from *L* into $c(L) = \{c(a) : a \in L\}$ whereas $o : L \longrightarrow SL$ is a dual lattice embedding taking finite meets to joins and arbitrary joins to meets.

Important examples of sublocales are the *open* and *closed* ones:

 $\mathfrak{o}(a) = \{a \to b : b \in L\}$ and $\mathfrak{c}(a) = \uparrow a = \{b \in L : a \leq b\}.$

Open and closed sublocales are complemented and

 $\neg \mathfrak{o}(a) = \mathfrak{c}(a)$ for each $a \in L$.

Also, for each $a_i, a, b \in L$:

 $\bigvee_{i\in I} \mathfrak{c}(a_i) = \mathfrak{c}(\bigvee_{i\in I} a_i), \qquad \mathfrak{c}(a) \wedge \mathfrak{c}(b) = \mathfrak{c}(a \wedge b),$ $\bigwedge_{i\in I} \mathfrak{o}(a_i) = \mathfrak{o}(\bigvee_{i\in I} a_i) \quad \text{and} \quad \mathfrak{o}(a) \vee \mathfrak{o}(b) = \mathfrak{o}(a \wedge b)$

Thus, $c : L \longrightarrow SL$ is an embedding from *L* into $c(L) = \{c(a) : a \in L\}$ whereas $o : L \longrightarrow SL$ is a dual lattice embedding taking finite meets to joins and arbitrary joins to meets.

Important examples of sublocales are the *open* and *closed* ones:

 $\mathfrak{o}(a) = \{a \rightarrow b : b \in L\}$ and $\mathfrak{c}(a) = \uparrow a = \{b \in L : a \leq b\}.$

Open and closed sublocales are complemented and

 $\neg \mathfrak{o}(a) = \mathfrak{c}(a)$ for each $a \in L$.

Also, for each $a_i, a, b \in L$:

 $\bigvee_{i\in I} \mathfrak{c}(a_i) = \mathfrak{c}(\bigvee_{i\in I} a_i), \qquad \mathfrak{c}(a) \wedge \mathfrak{c}(b) = \mathfrak{c}(a \wedge b),$ $\bigwedge_{i\in I} \mathfrak{o}(a_i) = \mathfrak{o}(\bigvee_{i\in I} a_i) \quad \text{and} \quad \mathfrak{o}(a) \vee \mathfrak{o}(b) = \mathfrak{o}(a \wedge b)$

Thus, $c: L \longrightarrow SL$ is an embedding from *L* into $c(L) = \{c(a) : a \in L\}$ whereas $o: L \longrightarrow SL$ is a dual lattice embedding taking finite meets to joins and arbitrary joins to meets.

 $\overline{S} = \bigvee \{\mathfrak{c}(a) : \mathfrak{c}(a) \leq S\}$ and $S^{\circ} = \bigwedge \{\mathfrak{o}(a) : S \leq \mathfrak{o}(a)\}.$

In particular $\overline{\mathfrak{o}(a)} = \mathfrak{c}(a^*)$ and $\mathfrak{c}(a) = \mathfrak{o}(a^*)$.

Also, for each
$$S, T \in SL$$
:

(1) $\overline{\{1\}} = \{1\}, \quad \mathring{L} = L, \quad \overline{S} \le S \le \mathring{S}, \quad \overline{\overline{S}} = \overline{S} \text{ and } \quad \mathring{S} = \mathring{S}.$ (2) $\overline{S \land T} = \overline{S} \land \overline{T} \text{ and } \quad \widehat{S \lor T} = \mathring{S} \lor \mathring{T}.$

$$f \in \text{USC}(L) \iff \bigvee_{q \in \mathbb{Q}} f(-,q) = 1 = \bigvee_{p \in \mathbb{Q}} f(p,-)$$
$$\iff \bigvee_{q \in \mathbb{Q}} f(-,q) = 1 \text{ and } \bigvee_{p \in \mathbb{Q}} \mathfrak{o}(\varphi(-,p)) = 1$$
$$\iff f \in \text{usc}(L).$$

We conclude that the restriction to usc(L) is also an order-isomorphism between usc(L) and USC(L).

$$f(-,q) := \mathfrak{c}(f(-,q))$$
 and $\varphi(p,-) := \bigvee_{r>p} \mathfrak{o}(\varphi(-,r)).$

Then

$$f \in \text{USC}(L) \iff \bigvee_{q \in \mathbb{Q}} f(-,q) = 1 = \bigvee_{p \in \mathbb{Q}} f(p,-)$$
$$\iff \bigvee_{q \in \mathbb{Q}} f(-,q) = 1 \text{ and } \bigvee_{p \in \mathbb{Q}} \mathfrak{o}(\varphi(-,p)) = 1$$
$$\iff f \in \text{usc}(L).$$

We conclude that the restriction to usc(L) is also an order-isomorphism between usc(L) and USC(L).

 Motivation
 Pointfree topology
 Semicontinuity
 sublocales
 Real valued functions
 Insertion results

 Localic real-valued functions
 characteristic functions

Given a complemented sublocale $S \in SL$ the characteristic function $\chi_S : \mathfrak{L}(\mathbb{R}) \to SL$ is defined by

$$\chi_{S}(-,q) = \begin{cases} 0 & \text{if } q \leq 0 \\ S & \text{if } 0 < q \leq 1, \\ 1 & \text{if } q > 1 \end{cases} \qquad \chi_{S}(p,-) = \begin{cases} 1 & \text{if } p < 0 \\ \neg S & \text{if } 0 \leq p < 1 \\ 0 & \text{if } p \geq 1. \end{cases}$$

Note that,

- $\chi_S \in \text{USC}(L)$ if and only if *S* is closed.
- $\chi_S \in LSC(L)$ if and only if *S* is open.
- $\chi_S \in C(L)$ if and only if *S* is clopen.

$$f^{\circ} \in LSC(L)$$

$$g \in LSC(L) \text{ and } g \leq f \implies g \leq f^{\circ}$$

$$(\chi_{S})^{\circ} = \chi_{S}^{\circ}$$

For $f \in F(L)$ we define the *lower regularization* f° :

$$f^{\circ}(-,q) = \bigvee_{s < q} \neg \overline{f(s,-)}$$
 and $f^{\circ}(p,-) = \bigvee_{r > p} \overline{f(r,-)}.$

$$f^{\circ} \leq f$$

$$f^{\circ \circ} = f^{\circ}$$

$$f^{\circ} \in \text{LSC}(L)$$

$$g \in \text{LSC}(L) \text{ and } g \leq f \quad \Rightarrow \quad g \leq f^{\circ}$$

$$(\chi_{S})^{\circ} = \chi_{S}^{\circ}$$

For $f \in F(L)$ we define the *lower regularization* f° :

$$f^{\circ}(-,q) = \bigvee_{s < q} \neg \overline{f(s,-)}$$
 and $f^{\circ}(p,-) = \bigvee_{r > p} \overline{f(r,-)}.$

$$f^{\circ} \leq f$$

$$f^{\circ \circ} = f^{\circ}$$

$$f^{\circ} \in LSC(L)$$

$$g \in LSC(L) \text{ and } g \leq f \quad \Rightarrow \quad g \leq f^{\circ}$$

$$(\chi_{S})^{\circ} = \chi_{S}^{\circ}$$

For $f \in \overline{F}(L)$ we define the *upper regularization* f^- :

$$f^-(-,q) = \bigvee_{s < q} \overline{f(-,s)}$$
 and $f^-(p,-) = \bigvee_{r > p} \neg \overline{f(-,r)}.$

$$f \le f^-$$

$$f^- = f^-$$

$$f^- \in \text{USC}(L)$$

$$g \in \text{USC}(L) \text{ and } f \le g \quad \Rightarrow \quad f^- \le g$$

$$(\chi s)^- = \chi_{\overline{s}}$$

For $f \in \overline{F}(L)$ we define the *upper regularization* f^- :

$$f^-(-,q) = \bigvee_{s < q} \overline{f(-,s)}$$
 and $f^-(p,-) = \bigvee_{r > p} \neg \overline{f(-,r)}.$

$$f \leq f^{-}$$

$$f^{--} = f^{-}$$

$$f^{-} \in \text{USC}(L)$$

$$g \in \text{USC}(L) \text{ and } f \leq g \quad \Rightarrow \quad f^{-} \leq g$$

$$(\chi_{S})^{-} = \chi_{\overline{S}}$$

Achievements

- One can see semicontinuous functions as a particular kind of real-valued functions on the frame of congruences, with the same domain, namely L(R).
- Being all upper and lower semicontinuous functions particular kinds of real-valued functions on the frame of congruences, we can compare them.
- By considering the algebraic operations of the ring Frm($\mathfrak{L}(\mathbb{R}), \mathcal{SL}$), we obtain, in particular, a way of defining the sum of upper and lower semicontinuous functions.
- The class of continuous functions is precisely the intersection of the classes of lower and upper ones.
- The situation with respect to regularization is precisely the same as in the topological setting.

Theorem (Katětov-Tong)

The following conditions on a frame L are equivalent:

- (1) L is normal.
- (2) For every f ∈ USC(L) and every g ∈ LSC(L) with f ≤ g, there exists h ∈ C(L) such that f ≤ h ≤ g.

Theorem (Tietze)

The following conditions on a frame L are equivalent:

- (1) L is normal.
- (2) For each closed sublocale S of L and each H ∈ C(S), there exists a continuous extension H̃ ∈ C(L) of H.

Theorem

The following conditions on a frame L are equivalent:

- (1) L is extremally disconnected.
- (2) For each open sublocale S of L and each H ∈ C(S), there exists a continuous extension H ∈ C(L) of H.
